

Model based design for vehicle thermal management

Case study overview

When an established automotive OEM from East Asia began work on its first electric vehicle project, it called in HORIBA MIRA to assist with the development of its holistic vehicle thermal management system (VTMS).

The customer required an independent external partner that could provide a complete design and development service.

HORIBA MIRA's expertise in this field helped to de-risk the project, with a 'right first time' approach that minimised the time and budget required.

Engineering team deployed: Seven consultants at HORIBA MIRA's UK facility.
